## **Objectives:**

- Demonstrate procedural steps of MT
- Practice angiography interpretation and decision-making
- Reinforce device selection and troubleshooting
- Emphasize possible complications, patient safety, anticoagulation/antiplatelet considerations, and post-procedure care

**Learning outcomes:** skills competency (device handling, vasculature navigation), situational awareness, complication management

### **A. Simulation-based skills**

Participants will rotate through 3 stations using Vascular phantoms or 3D-printed models beginning with an orientation presentation and demonstration, discuss procedural steps and safe practice and ending with group debriefing session.

By the end of the stations; participants should be able to demonstrate the anatomy of cerebral circulation and typical occlusion sites, indications and contraindications for MT, review the latest guidelines and evidence (e.g., core trials, patient selection criteria), anesthesia considerations (general anesthesia vs. monitored anesthesia care) and demonstrate different devices: stent retrievers, aspiration catheters, neurovascular microcatheters and microwires.

### **Station design (example layout)**

- **Station 1:** Vessel navigation in a straight segment and tortuous anatomy,

# 8<sup>th</sup> IESC & 10<sup>th</sup> MENA STROKE

- **Station 2:** Clot engagement with a stent retriever & Aspiration technique and combined approaches
- **Station 3:** Complication management and rescue strategies and common pitfalls

Station Number	Station content	Learning Objective Discussion Points	Material Resource s	Didactic / Speaker
1	Endovascular Simulator for orientation & procedural steps	Steps of interventional procedure.	Simulation model with high-fidelity vascular simulators or benchtop models with realistic clots	Intro to LVO and neurovascular anatomy in the context of neurointervention for mechanical thrombectomy procedure.
2	Thrombectomy Procedure.	<p>Approach to parent vessel for target intervention based on anatomy. Diagnostic catheter shape for arch navigation; use of complex-curve shapes. Guide catheter selection and preparation</p> <p>Power-flush of stent-retriever sheath. Aspiration first technique. Combined approaches; stent-retrievers plus aspiration.</p>	Flow model with Variably sized Stent-retrievers and aspiration catheters.	Vessel imaging findings (anatomic, pathologic) to determine optimal thrombectomy device for first pass effect.
3	Complication management and rescue strategies	How to deal with complications and rescue stenting	Flow Model with stents	<p>Discussion about possible complications (Vasospasm, vessel perforation, dissection, distal embolization to new territory and device-related complications and how to manage them)</p> <p>Discussion about change the strategy and rescue stenting</p>

## B. Previous cases for discussion

Each station uses a checklist of:

- Pre-procedure plan (NIHSS and clinical picture, imaging)

# 8<sup>th</sup> IESC & 10<sup>th</sup> MENA STROKE

- Device choice rationale
- Time markers
- Complications anticipated and management steps
- Post-procedure imaging assessment

## **Assessment and feedback**

- Checklists for each station
- Rapid feedback sessions after simulations
- Previous real cases discussion and debriefing with emphasis on what went well and areas for improvement

## **Training materials and assessment**

- **Pre-workshop:** distribute reading packets covering MT basics, device indications, and safety
- **During workshop:** hands-on practice with defined objectives, real-time coaching
- **Post-workshop:** survey to assess confidence, a short quiz on indications and management, and a debrief session

## **Follow-up and continuous improvement**

- Create a resource library with videos and guidelines
- Schedule periodic refreshers or advanced modules
- Track attendees' performance over time and tailor future sessions to gaps
